

blanking

nick-breaking blanking

Perfect blanking of small cards

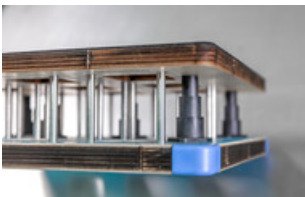

Nick-breaking. A new marbach technology. That allows blanking of small cards with a double knife without problems. Such as blister cards. Or credit card sized cards. And many more.

In the nick-breaking tools, the punches in the male blanker are replaced by special pins. These are positioned in a way that the nicks can be separated specifically and in a controlled manner. So the ups fall down vertically. Without twisting. Or tilting. This allows significantly faster machine speeds in special application scenarios with small cards. Without time-consuming machine stops. The blanks can be separated securely. And stacked neatly.

no twisting or tilting of the cards

controlled separation of nicks

high machine speeds
